The invention relates to a method for identifying a compound that increases the mutation rate of hepatitis C virus (HCV), comprising checking an increase in HCV quasispecies produced by the cell in the presence of the candidate compound by e.g. sequencing HCV nucleic acid molecules isolated from the test cell. The method involves providing a test cell containing a nucleic acid molecule comprising a first nucleotide sequence consisting of an infectious hepatitis C viral genome or its DNA copy, a second nucleotide consisting of a ribozyme or its DNA copy, and an inducible promoter operably linked to the first and second nucleotide sequences, where the ribozyme is configured to remove a 3 contacting the test cell with a candidate compound and detecting an increase in HCV quasispecies produced by the cell in the presence of the candidate compound compared to tend in the absence of the compound increase in the HCV quasispecies indicates that the compound increases that may be used for treating HCV The method is useful in identifying compounds the mutation rate of HCV. The method is useful in identifying compounds the increase in the mathod sequence represents a configured to amplify an HCV genomic DNA region, used in the method

```
The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoietin, apptiosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines, interferons, interleukins, Groteins, cytochromes, kinesins, cytokines, interferons, interleukins, Groteins coupled receptors and thioesterases. The present sequence is one such oligonucleotide. The oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune conserved in the proteins listed above. Siscases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus and Grave's diseases), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, contrained the proteins listed and infection of pathogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

combined with a second nucleic acid will generate an amplification product from M. paratuberculosis but not from human, Pseudomonas acruginosa, Strepfomyces viridochromogenes, mouse, cat or Xanthomonas campestris. The nucleic acids and other sequences specific for Mycobacterium paratuberculosis are used to detect M. paratuberculosis in e.g. milk, faeces or blood. The polypeptides encoded by these sequences, and antibodies directed against them, are also used to detect M. paratuberculosis by immunoasay. The nucleic acids and the polypeptides are also used as vaccines to prevent infection (Johne's disease) by M. paratuberculosis. The antibodies are also useful for polypeptide paratuberculosis. The sequence represents a PCR primer used to amplify an M. paratuberculosis nucleic acid of the invention.

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwb42 (gilfa732114 [gb]AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xil0-Gold (Stratagene) cells and selected for ampicillin resistance."

/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus G57BL/G/ (male) was obtained from the Jackson
Laboratory Mouse DNA Resources/documents/dntp://www.jax.org/resources/documents/dntps://ww.jax.org/resources/documents/dntps://ww.jax.org/resources/documents/dntps://ww.jax.org/resources/documents/dntps://ww.jax.org/resources/documents/librares/). The DNA
was blunt end-repaired by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with Tq DNA polymerase and Tq
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis vector DNA was prepared from a derivative
of pWD42 (gil 4732114)gb|AR129072.1), a copy-number
inducible derivative of plasmid Rl. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to

/note="Organ: leaf; Vector: RescueMu (engineered from pBlueScript backbone); Site 1: Bamil; Site 2: BglII;
RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmdb.isatate edu' and follow the links for 'RescueMu.' Grid K was grown at Molokai, Hawaii in Winter 2000-2001. DNA was extracted from leaf punches, double digested using Bamil and BglII, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with ampicillin."

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwMD42 (gilfa732114 [gb] AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chamically-competent E. coll XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      5

/mol_type="remove or properties" / mol_type="remove or properties" / mol_type="remove or properties" / mol_type="remove or primary large fibroblasts" / clone_lib="HIV-vector integration sites in human IMR90 primary lung fibroblasts" / lung fibroblasts (IMR90) were / note="Human primary lung fibroblasts (IMR90) were infected with an HIV-based vector. DNA was isolated and cleaved with restriction enzymes; linkers were ligated onto the cleaved DNA and DNAs were amplified using one primer that bound to the linker DNA and one that bound to the HIV cDNA. Junctions between integrated HIV proviruses and cellular DNA were cloned and sequenced."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AU105070 50 bp mRNA linear EST 28-JAN-2004 AU105070 Sugano Homo sapiens cDNA library Homo sapiens cDNA clone

/clone libe 1351 - RescueMu Grid P"
/clone libe 1351 - RescueMu Grid P"
/note="Organ: leaf; Vector: RescueMu (engineered from pBlucScript backbone); Site 1: BamHi, Site 2: BglII;
RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription units: Por more information on RescueMu, go to the web site 'www.zmdb.iastate.edu' and follow the links for 'RescueMu.' Grid P was grown at Molokai in 2002. DNA was extracted from leaf strips, double digested using BamHI and BgIII, and ligated to form circular plasmids. DH108 cells were transformed and then screened on LB plates with ampicillin."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Arabidosis thaliana T-DNA flanking sequence, left border, clone A.590023
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Brunaud, V., Balzergue, S., Dubreucq, B., Aubourg, S., Samson, F., Ahauvin, S., Bechloid, N., Cruaud, C., DeRose, R., Pelletier, G., Lepiniec, L., Caboche, M. and Lecharny, T. T. DNA integration into the Arabidopsis genome depends on sequences

Mouse whole genome scaffolding with paired end reads from 10kb plasmid inserts
           plants from INRA (versailles). The DNA fragment(s) regulation the PCR were directly sequenced from the left or the right border to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed. Information to order the corresponding mutant line and a link to a database providing a graphical display of the insertion site are available at the typ://dbsgap.versailles.inra.fr/publicalines/. This sequence has program 'Genoplante' (http://www.genoplante.org. infobiogen.fr).

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114[gplAR128072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complamentary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll X110-GG1d (Stratagene) cells and selected for ampicillin resistance."

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence Sequence Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 11, Application US/09154219

Patent No. 6635443

GENERAL INPORMATION:

APPLICANT: Shi, Yanggu

APPLICANT: Ruben, Steve M.

TITLE OF INVENTION: Interleukin 17 Receptor-Like Protein

FILE REPRENCE: PF398

CURRENT APPLICATION NUMBER: US/09/154,219

CURRENT FILING DATE: 1998-09-16

EARLIER APPLICATION NUMBER: 60/059,133

EARLIER PILING DATE: 1997-09-17

NUMBER OF SEQ ID NOS: 13

SOFTWARE: PatentIn Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GENERAL INFORMATION:

Patent No. 5882852
GENERAL INFORMATION:
APPLICANT: BUCH, J., MILLER, R.H. AND
APPLICANT: PURCELL, R.H.
TITLE OF INVENTION: NUCLEOTIDE AND DEDUCED
TITLE OF INVENTION: AMINO ACID SEQUENCES OF THE ENVELOPE 1 AND
TITLE OF INVENTION: CRE GENES OF ISOLATES OF HEPATITIS C VIRUS
TITLE OF INVENTION: SEQUENCES IN DIAGNOSTIC METHODS AND VACCINES
TITLE OF INVENTION: SEQUENCES IN DIAGNOSTIC METHODS AND VACCINES
CORRESPONDENCE ADDRESS:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  US-08-998-099-161/C

Sequence 161, Application US/08998099A

Patent No. 6103890

GENERAL INFORMATION:
APPLICANT: ARCHIGGEN, JAMES A.

APPLICANT: ARCHIGGEN, JAMES A.

TITLE OF INVENTION: ENZYMATIC NUCLEIC ACID TREATMENT OF DISEASES

TITLE OF INVENTION: OR CONDITIONS RELATED TO LEVELS OF C-FOS

TITLE OF INVENTION: DAY T.

TILE OF INVENTION: BAZYMATIC NUCLEIC ACID TREATMENT OF DISEASES

TITLE OF INVENTION: BAZYMATIC NUCLEIC ACID TREATMENT OF DISEASES

TITLE OF INVENTION: ENZYMATIC NUCLEIC ACID TREATMENT OF DISEASES

TITLE OF INVENTION: ENZYMATIC NUMBER: US/08/998,099A

CURRENT FILING DATE: 1997-10-23

EARLIER FILING DATE: 1997-01-23

EARLIER PELING DATE: 1995-01-13

EARLIER PELING DATE: 1995-01-13

EARLIER FILING DATE: 1995-01-18

EARLIER FILING DATE: 1994-05-18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ; OTHER INFORMATION: Description of Artificial Sequence:Synthetic DNA US-09-673-198-23
